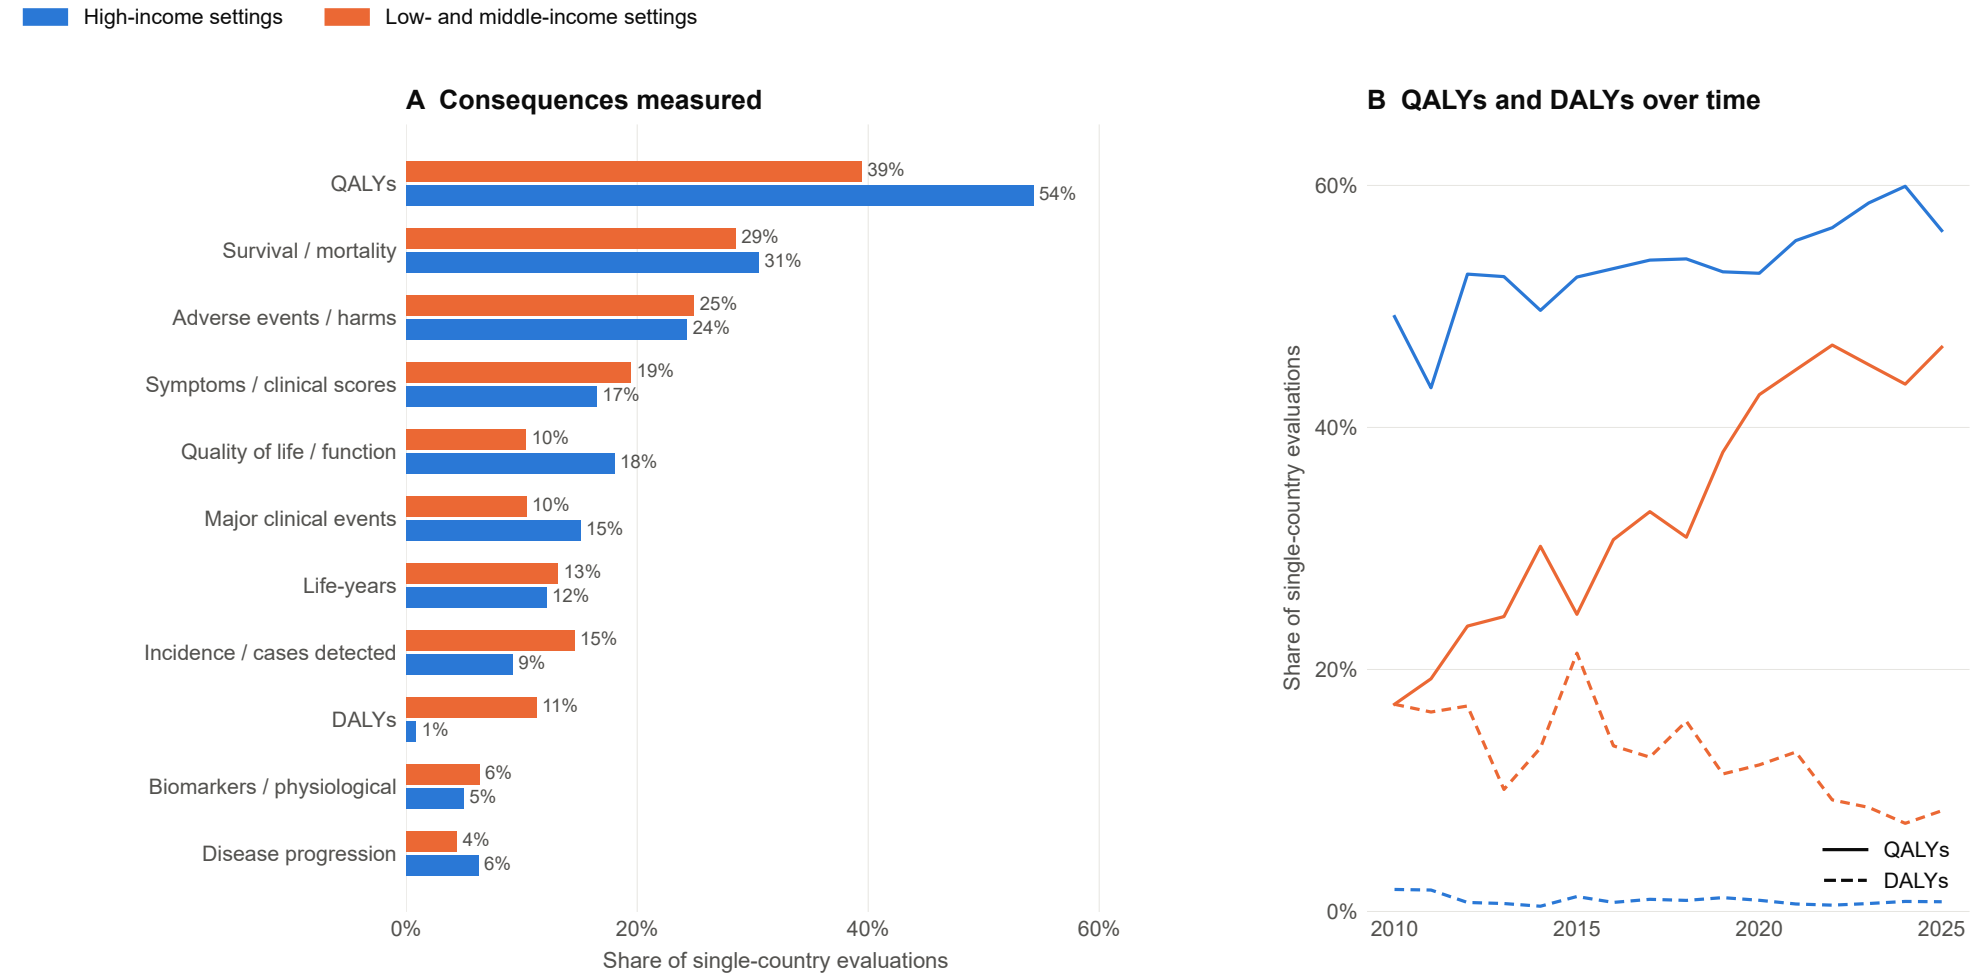
Consequences measured by health economic evaluations, by income setting



Base: 27,897 single-country eligible studies with a known publication-year World Bank income group (20,236 high income; 7,661 low and middle income). A study can report several outcome families. Panel A omits the residual other-clinical family and families below 5% in both settings. Panel B excludes incomplete 2026. Consequences are extracted from titles and abstracts; reporting does not establish quality.
