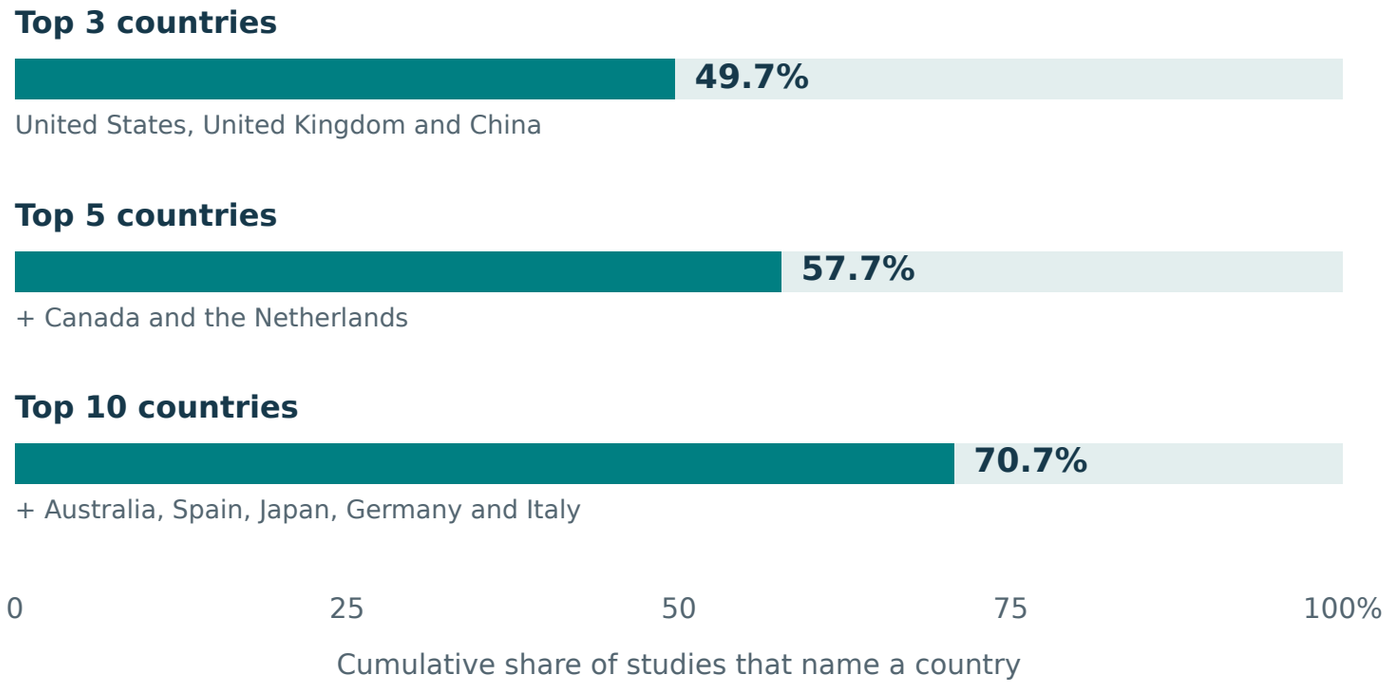
Health economic evidence is concentrated in a few countries

Broad geographic coverage masks a highly uneven distribution of studies

A | Study concentration



B | Geographic coverage

187 / 204

countries or territories represented

98.7%

of geographies with >1 million people had at least one evaluation

71.9% of evaluations named one or more countries.

C | Evidence relative to population

13.1×

higher median in high-income countries

0.84

Gini coefficient of country-level study counts

Notes: Country groups in panel A are cumulative; multi-country studies are counted once within each group.
Panel C includes countries with >1 million people. Gini includes represented countries, counting studies once per country; including countries with no studies gives 0.842. Coverage exceptions among geographies with >1 million people: Eritrea and Mauritius.
Source: supplied manuscript summary statistics. Ratios calculated from the reported medians.
