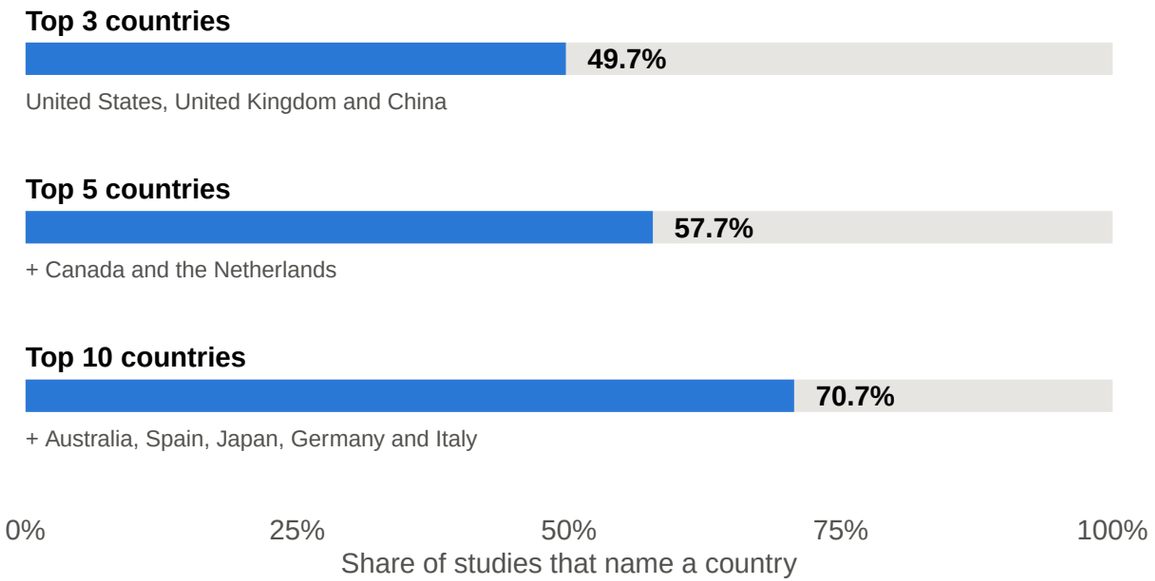
Health economic evidence is concentrated in a few countries

A Study concentration



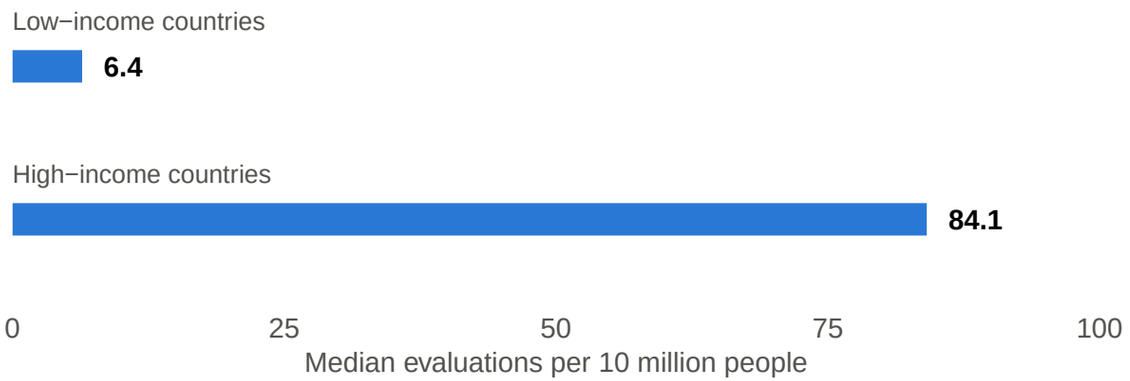
B Geographic coverage

187 / 204
countries or territories represented

98.7%
of geographies with >1 million people had at least one evaluation

71.9%
of evaluations named one or more countries

C Evidence relative to population



D Inequality in evidence

13.1 times
higher median in high−income countries

0.84
Gini coefficient of country−level study counts

Country groups in A are cumulative. Multi−country studies are counted once within each group. C includes countries with >1 million people; the ratio in D is calculated from the reported medians.
Gini counts studies once per country among represented countries; including countries with no studies gives 0.842. Eritrea and Mauritius are the coverage exceptions among geographies with >1 million people.
